EXECUTIVE SUMMARY

This report summarizes the District of West Vancouver's water quality program for 2013. Sampling has been carried out in accordance with the protocol developed with Metro Vancouver and member municipalities; where objectives exist, monitoring results are compared to the *Guidelines for Canadian Drinking Water Quality*.

The District operates a system that treats and distributes potable water supplied from two local sources, namely Eagle Lake and Montizambert Creek and from purchased, bulk, treated water from Metro Vancouver (Capilano or Seymour sources). Detailed information regarding the Metro Vancouver supply can be found through direct contact with the regional district.

Raw water from both Eagle Lake and Montizambert Creek sources is analyzed for bacteriological, physical and chemical parameters. Bacteriological testing in 2013 revealed source waters to have very low presence of Escherichia coli (E. coli), giardia, and cryptosporidium.

Water throughout the distribution system was tested for bacteriological, physical and chemical parameters. Samples for total coliforms and E. coli were all negative with the exception of one site that tested positive for total coliform for one sample. This was due to a faulty sample line which was subsequently replaced. Tests showed turbidities of greater than 5 NTU in only three distribution samples for the year. Tests showed turbidity less than 1 NTU in 98.3 % of all distribution system samples. In locations where samples were above the guideline, water mains were flushed until turbidity dropped to an acceptable level. Chlorine residual tests for all samples tested above the recommended minimum level of 0.2 ppm with the exception of one sample taken from a faulty sample site. Testing for the disinfection by-products, trihalomethanes and haloacetic acids, indicated levels were within Canadian guidelines for all sites.

1.0 INTRODUCTION

This report summarizes the District of West Vancouver's water quality program for 2013. The purpose is to detail the municipality's efforts in maintaining high quality drinking water and to provide residents with the results of the sampling and analysis program.

Water suppliers in British Columbia are regulated by the Drinking Water Protection Act and the Drinking Water Protection Regulation (DWPR). This *Drinking Water Quality Annual Report* is a requirement of the Vancouver Coastal Health Authority (VCHA) in order to receive annual operating permits and is reviewed by the Medical Health Officer (MHO) for the North Shore. As requested by the MHO, this report shall be made public by a prominent web site posting at <http://www.westvancouver.ca>.

The District's water quality program has been carried out in accordance with the document entitled, *Water Quality Monitoring and Reporting Plan for the GVRD and Member Municipalities, May 2000*, which was developed under the authority and direction of the Regional MHOs

2.0 GENERAL DESCRIPTION

The District of West Vancouver operates two water supplies and a distribution system consisting of a network of intakes, chlorination stations, reservoirs, pressure reducing valve (PRV) stations, pumps and pipes. The system is required to adequately receive, store, and transport potable water to all users in West Vancouver. Key facilities are connected by a telemetry system (SCADA) to a central computer, which monitors the system, identifies faults and sends alarms to key personnel 24 hours a day.

3.0 SOURCE WATER WATERSHEDS

3.1 General

The municipality obtains water from three sources:

- Eagle Lake;
- Montizambert Creek; and
- Bulk, treated water purchased from Metro Vancouver.

From Horseshoe Bay to the eastern municipal boundary, residents are serviced by a water distribution system that is fed by both Eagle Lake and Metro source waters. While the distribution area for each source varies seasonally, in general, Eagle Lake water is received below the Upper Levels Highway (ULH), west of the McKechnie Reservoir, east to 27th Street on the Mathers Avenue water main and above the ULH, east to the Chartwell neighbourhood. The municipality continues to expand the use of the Eagle Lake source whenever supplies permit in order to reduce the purchase of bulk water from Metro Vancouver. North of Horseshoe Bay at

the northern municipal boundary, the Sunset Highlands neighbourhood is serviced by the Montizambert Creek source, with the exception of the Seascapes multi-family development, which utilizes private wells.

3.2 Eagle Lake Treatment Plant

Located above Cypress Falls Park, Eagle Lake source waters flow through intake screens (with an opening size of 0.54 mm) before entering the treatment plant by gravity. When the lake level is below the elevation of the intake screens, floating pumps are required to pump water from the lower lake levels to the treatment plant. This occurs occasionally, typically during the late summer months.

Once the water enters the treatment facility, it passes through an automatic self cleaning bar screen to remove any floating debris. The water is pH adjusted and coagulant added to optimize the membrane filtration process. The coagulated water is then pumped and filtered through 3 first stage submerged membrane filters. Once filtered, chemicals are added for disinfection and corrosion control. Fully treated water is stored in concrete reservoirs ready to be distributed.

3.2.1 Operation

According to Sec 9 (1) of the Drinking Water Protection Act (DWPA), subject to regulations, a person must not operate, maintain or repair a prescribed water supply system unless:

- (a) the person is qualified in accordance with the regulations to do this, or
- (b) is doing this under the supervision of a person who is qualified in accordance with the regulations

Eagle Lake Treatment Plant is classified as a Level 3 facility in accordance with the Environmental Operators Certification Program (EOCP) and during 2013 the plant was operated and maintained by a level 3 operator with support from level 2 (1) and level 1 (1) operators, the lower level operators will continue to work towards the higher levels of certification.

In 2014, the District will be recruiting a certified operator to replace a recently vacated position.

3.2.2 Eagle Lake Water Treatment Plant Bypass and Optimization

In the event of an operational emergency the Eagle Lake plant may need to be bypassed in order to keep supplying water to the District's residents and for fire demand. Although the filtration process will be bypassed, the water will continue to be disinfected with sodium hypochlorite but at a higher dose and longer contact time to compensate for the loss of filtration.

All EOCP certified staff is familiar with the details of the bypass procedure. The details of this procedure have been provided separately in the Eagle Lake Water Treatment Plant Emergency Response and Contingency plan to VCHA.

The Eagle Lake Treatment Plant was not bypassed during 2013.

The infrastructure needed to optimize the use of the Eagle Lake supply system was completed in June, 2010. The Eagle Lake optimization has allowed the District to increase the supply of Eagle Lake water to the distribution system during non peak periods. The District SCADA system is used to automatically monitor and prompt any required changes to the system based on plant conditions such as clear well level and system demand. During extended periods when a plant operator is expected to be unavailable, a procedure is in place to allow the plant to function under a reduced demand scenario with some areas which are typically supplied by Eagle Lake transferred to the Metro supply. Should the plant experience any operational difficulties which affect production, the SCADA system will automatically take over and a Metro supply will be introduced to the Eagle Lake distribution system.

Standby personnel monitor the Eagle Lake Water Treatment Plant operation 24/7 and VCH are notified should there be any changes to operational procedures.

3.3 Montizambert Treatment Plant

The EOCP Level 3 classified Pall Membrane Treatment Plant (Montizambert) was successfully commissioned in September 2011 and is compliant with the 4-3-2-1 multi-barrier approach as specified in the GCDWQ to ensure safe drinking water as mandated by the Health Authorities of British Columbia.

The introduction of the treatment plant has resulted in a reduction of maintenance (main flushing) hours required to maintain a minimum chlorine residual of 0.2mg/L within the Montizambert Creek distribution system.

The source water from Montizambert Creek passes through a gravel filtration intake and a settling tank before entering the Montizambert Treatment facility. Once the water enters the plant it is mixed with a coagulant and pumped and filtered through the membrane filters. After the filtration process, chlorine is added for disinfection and the water is stored in concrete reservoirs ready to be distributed.

3.3.1 Montizambert Water Treatment Plant Bypass

In the event of an operational emergency the Montizambert Water Treatment Plant may need to be bypassed to continue supplying water to residents and for fire demand. The Montizambert Water Treatment Plant is capable of two different types of bypass, one with cartridge filters and the second without. The use of cartridge filters will be determined on a case by case basis. Either way, the water will continue to be disinfected with sodium

hypochlorite but adjusted to an appropriate dosage rate and contact time depending on the bypass process.

All EOCP certified staff are familiar with the details of the bypass procedure. The details of this procedure have been provided separately in the Montizmabert Creek Water Treatment Plant Emergency Response and Contingency plan to VCHA.

3.4 Metro Vancouver

Bulk treated water purchased by the District from Metro Vancouver for servicing is supplied from the Seymour and Capilano sources. This water enters the municipality's distribution system at five locations:

- Marine Drive and Capilano Road;
- Capilano Road and Welch Street;
- Glenmore Reservoir;
- Capilano Road and Upper Levels Highway; and
- 3105 Capilano Road.

3.5 Challenges

Challenges to the quality and quantity of the source water include:

- maintaining a balance between public access for recreation (e.g., portion of the Baden Powell Trail above Eagle Lake) and security of the watershed for protection of drinking water quality;
- physical disturbances in watersheds such as soil erosion into creeks, which lead to turbidity spikes;
- vulnerability of open water sources to contamination from animal and human activity;
- maintaining creek flow supplementation for fish habitat during the summer months, when Eagle Lake level is low; and
- Low flow conditions in Montizambert Creek during drier summer months.

4.0 REGULATIONS AND STANDARDS FOR SOURCE WATER AND THE DISTRIBUTION SYSTEM

Both source waters and water within the distribution system are tested for microbiological, chemical and physical parameters. For the purposes of the municipality's own water quality sampling program, locations monitoring Metro water are treated as 'distribution', not 'source' sites; however, some Metro sample points have been located close to the entry points to the municipal distribution system.

The Drinking Water Protection Regulation (DWPR) requires 1 sample / 1000 residents on a monthly basis for cities with a population between 5000 and 90,000 residents. During 2013 the District of West Vancouver had approximately 45,000 residents, which equates to 540 samples required annually. The total number of samples collected for the District during 2013 was 610. Therefore, the current number of stations and samples provide the number of tests as required by the DWPR.

Further to the information outlined below, full details outlining the health based guidelines for water quality in Canada, established on behalf of the Federal-Provincial-Territorial Committee on Drinking Water, can be found on Health Canada's website.

4.1 Microbiological Parameters

Under the Guidelines for Canadian Drinking Water Quality (GCDWQ) the most vital guidelines are those dealing with microbiological contaminants. The District of West Vancouver follows the guidelines by taking the required samples at the regulated times.

Samples are taken monthly at the source for Cryptosporidium and Giardia. The treatment goal for these two parameters is a minimum of 3 log removal.

Escherichia coli (E. coli) samples are taken bi-weekly at the source and weekly throughout the distribution system. E. coli is an indicator of microbiological safety, the GCDWQ maximum allowable concentration is none detected per 100 mL sample.

Heterotrophic Plate Count (HPC) is tested bi-weekly at the source as well as weekly throughout the distribution system. Although it is naturally occurring and has no limits under the guideline it is a good monitoring tool for general bacteriological water quality.

Total Coliform is sampled bi-weekly at the source and weekly throughout the distribution system. Total coliforms are not used as indicators of potential health effects from pathogenic microorganisms; they are used as an operational tool to determine how well the drinking water treatment system is operating. When sampled in the distribution system the GCDWQ states that no consecutive samples contain total coliform and that no more than 10% of samples taken contain total coliform. Total coliform detected in the distribution system can be an indication of re-growth of bacteria in distribution biofilms or intrusion of untreated water.

The analysis for Giardia and Cryptosporidium was conducted by IG MicroMed Environmental Inc. Analysis for Total Coliform, E. coli and HPC were conducted by Metro Vancouver Laboratories.

4.2 Physical Parameters

4.2.1 Turbidity

Turbidity describes the amount of suspended solids in water. It is measured in nephelometric turbidity units (NTU). The presence of turbidity can have significant effects on both the microbiological quality of water and the detection of the bacteria and viruses. The target turbidity for treated water from the Eagle Lake and Montizambert Water Treatment Plants is less than 0.1 NTU with the intent not to exceed 0.3 NTU at any time. The Guidelines for Canadian Drinking Water Quality supporting documentation states that the turbidity should not exceed 5.0 NTU within the distribution system especially at the point of consumption for aesthetic purposes.

4.2.2 Temperature

The aesthetic guideline for temperature is 15°C. Typically, the temperature of drinking water for both the source water and the distribution system rises during summer months. District staff appreciate that higher temperatures in the distribution system can affect chlorine residuals and can contribute to bacterial re-growth. Tests completed on a regular basis throughout the distribution system are used to ensure acceptable water quality.

4.2.3 Colour and Residue

Physical parameters of colour and residue are tested together with chemical parameters for Eagle Lake and Montizambert source water. With respect to colour, the GCDWQ specifies an aesthetic objective of less than 15 true colour units (TCU).

4.3 Chemical Parameters

Testing of source waters for chemical parameters, including bromate, bromide, chlorate, chloride and sodium is conducted semi-annually at both Eagle Lake and Montizambert Creek.

In the distribution system, chemical parameters tested include chlorine residual, trihalomethanes (THMs), haloacetic acids (HAAs), and pH. Chlorine residual is measured at all sampling sites when bacteriological samples are collected; additionally there are several online chlorine analyzers for continuous monitoring through the distribution system.

4.3.1 Disinfection By-Products

Disinfection by-products are formed when chlorine reacts with natural organic matter. The two main categories of disinfection by-products are trihalomethanes (THMs) and haloacetic acids (HAAs). THMs are included in the GCDWQ with an interim maximum acceptable concentration (IMAC) of 100 parts per billion (ppb). HAAs are not regulated in Canada, however, consultation concluded in late 2010 suggest a potential maximum level of 80 ppb.

4.3.2 pH

The water's acidity or basicity is measured as pH. The GCDWQ recommends a pH in the range of 6.5-8.5 as a treatment objective. Both Eagle Lake and Montizambert sources tend toward the

lower bound of 6.5. It is recognized that acidic water will accelerate the corrosion of metal pipes as well as hinder the treatment process. West Vancouver pH adjusts to above 7.0 and injects a low level of zinc orthophosphate at its treatment facilities, both to optimize the treatment process and to reduce the corrosion of its metallic pipes in the distribution system.

4.3.3 Metals

The District's water quality sampling and monitoring program includes semi-annual testing at four locations within the distribution system for a variety of metals.

5.0 TESTING, SAMPLE ANALYSIS AND RESULTS

Microbiological testing was conducted at a total of 37 sampling sites, not including Eagle Lake and Montizambert Creek source locations, but including sites near the entry point of Metro Vancouver water into the municipal distribution system. The monitoring protocol dictates that 12-13 sites per week are sampled according to a breakdown as follows: 10% source water, 10% low flow/dead end locations, 40% medium flow locations, and 40% high flow locations. Table 1 outlines the District's water sampling and testing calendar.

Table 1 Water and Sampling and Testing Calendar

Water Type	Parameter	Frequency
Sources Eagle Lake Montizambert Creek	Microbiological, Turbidity, Temperature	Bi-weekly
	Giardia, Cryptosporidium	Monthly
	Chemical, physical list	Semi-annually
Distribution System	Microbiological, Turbidity, Temperature	Weekly (not at every site)
	HAA's, THM's, pH	Quarterly
	Metals	Semi-annually

5.1 Sample Analysis – Source Water (untreated)

At Eagle Lake, 26 bi-weekly source water samples were tested. A very low presence of E.coli was detected; 22 samples showed a most probable number (MPN) of less than 1 per 100 mL and 2 samples indicated 1 MPN, 2 samples showed presence of E. coli ranging from 2 to 14 MPN/100mls. Testing for total coliforms showed results ranging from 2 – 800 MPN-/100mls in the raw, untreated source water.

Table 2A Eagle Lake Source Water Microbiological and Physical Parameters

Sample Name	No. Samples	Turbidity NTU			Temperature °C			Total Coliform MPN/100mLs			Ecoli MPN/100mLs			HPC CFU/mls		
		Min.	Avg.	Max.	Min.	Avg.	Max.	Min.	Avg.	Max.	Min.	Avg.	Max.	Min.	Avg.	Max.
WEAG-LK1	26	0.21	0.39	1.2	3	8.81	18	2	148.19	800	<1	4.50	14	74	218.50	600

At Montizambert Creek, the 27 bi-weekly samples tested for E.coli with 18 samples yielding results of less than 1 MPN, 3 samples indicated 1 MPN and the remaining 6 samples showed presence of E. coli ranging from 2 to 16 MPN/100mls. Total Coliform testing results ranged from less than 5 – 470 MPN/100mls prior to treatment.

Table 2B Montizambert Creek Source Water Microbiological and Physical Parameters

Sample Name	No. Samples	Turbidity NTU			Temperature °C			Total Coliform MPN/100mLs			Ecoli MPN/100mLs			HPC CFU/mls		
		Min.	Avg.	Max.	Min.	Avg.	Max.	Min.	Avg.	Max.	Min.	Avg.	Max.	Min.	Avg.	Max.
WMZ-CK1	27	0.2	0.98	2.4	3	8.00	14	5	101.78	470	<1	3.44	16	94	231.60	1300

Giardia and Cryptosporidium testing was conducted monthly for both sources. Eagle Lake showed one positive sample of 1 Giardia species per 100 L. Montizambert Creek showed 2 positive samples of 1 Giardia per 100 L and 1 positive sample of 1 Cryptosporidium per 100 L, all other samples were negative.

Source water chemistry testing is conducted at Eagle Lake and Montizambert on a semi-annual basis, source water chemistry testing results are shown in Appendix B along with a full range of other chemicals parameters which are not included in the guidelines but are still monitored by the District.

5.2 Sample Analysis – Distribution System

A map of the District's water system and list of District sample sites for the distribution system with locations can be found in Appendix A. While the naming convention includes a reference to the predominant water source, in fact for some locations depending on the hydraulic conditions, water can be provided from either Eagle Lake or Metro Vancouver.

Distribution system samples for E.coli were all negative except for one sample with two total coliform counts being detected at a Metro Vancouver sampling point. This false reading was caused by a faulty sampling line which was replaced.

In the event of detection of total coliforms in a sample, the municipality's water quality personnel and the MHO would be notified via the Metro Labs; procedures would be followed as outlined in section 8.1 of this report.

In a few instances (7) sites from all three distribution sources showed HPC counts that exceeded 500 CFU/100 mL; in no instance did a HPC exceedance correspond to the presence of E.coli. Elevated HPC is not an indication for water safety concerns but an operational indicator of possible stagnation and potential degradation of water quality. Where HPC results exceeded 500 CFU/100 mL water mains were flushed and turbidity readings and chlorine residuals checked.

All samples within the Eagle Lake, Montizambert and Metro Vancouver testing results met the guideline of greater than 0.2 ppm chlorine residual with the exception of one sample which was taken from a faulty sample site, additional samples were taken and the required level of disinfection was achieved. Turbidity results for the distribution system indicated 99.7% of all samples tested met the GCDWQ aesthetic objective of below 5 NTU with only three instances where a turbidity level of greater than 5 NTU was recorded, one from a Metro supply and two from the Montizambert supply. The District responded by alerting VCH and the corresponding sections of main were flushed until a satisfactory result was obtained. Testing results in their entirety can be found in Appendix C of this report.

Table 3 Distribution System Microbiological and Physical Parameters (WVR Sites)

Location ID		Chlorine Residual (ppm)			Turbidity (NTU)			Temperature (°C) (Aesthetic Objective)			HPC (CFU/ml)			E. coli MPN/100mLs	Total Coliform MF/100mLs

Testing for metals within the distribution system are summarized in Appendix C, all metals within the metals scan were well within GCDWQ guidelines with the exception of one slightly elevated Iron Total of 0.951 mg/L (Health Canada Guideline is <0.3 mg/L)

Disinfection by-products are formed when chlorine reacts with natural organic matters. The two main categories of disinfection by-products are trihalomethanes (THMs) and haloacetic acids (HAAs) which are monitored on a quarterly basis at a total of 10 sites. The test results are presented as a running quarterly average for both THMs and HAAs; reported results for quarterly averages of THMs and HAAs did not exceed the guideline levels within the distribution system.

The level of natural organic matters is typically characterized by measuring total organic carbon (TOC) in a laboratory. Organic carbons originate in water from partially dissolved organic materials from algae, leaves, bark, wood, soil and other similar materials which are also responsible for a significant portion of the colour found in natural water sources.

Optimization of the coagulation process and pH adjustment resulted in reduced TOC levels which lead to a reduction in disinfection byproducts.

A comparison of the yearly average results for disinfection by-products for THM and HAA monitored at 10 sites from 2012 to 2013 is presented in Table 5 below. 6 out of the 10 site have decreased THM levels between 5 to 32 percent and 6 out of 7 sites have decreased HAA levels from 13 to 44 percent.

Table 5 Comparison of Yearly Average for 2012 to 2013 Disinfection By-Products

Sample Location	Total THM			Total HAA		
	Yearly Average (2012)	Yearly Average (2013)	% Difference	Yearly Average (2012)	Yearly Average (2013)	% Difference
WEAG-772	64	51	-25%	62	48	-29%
WEAG-773	87	69	-25%	55	46	-19%
WEAG-776	55	52	-5%			
WEAG-778	67	51	-32%	65	46	-40%

WVR-717	21	31	32%			
WVR-764	17	23	27%	32	22	-44%

Testing results for the Disinfection Byproducts are fully detailed in Appendix C.

6.0 PUBLIC NOTIFICATION

6.1 Drinking Water Advisory/Boil Water Advisory

2013 was relatively free of significant turbidity events, with the exception of some minor elevated levels of turbidity from Metro Vancouver sources. As a result of these events Metro Vancouver took its Capilano source off line on several occasions, leaving the Seymour source in operation. The regional health officers did not issue any boil water advisories.

6.2 General Drinking Water Quality Advisory

No General Drinking Water Advisories were issued in 2013.

7.0 OPERATOR QUALIFICATIONS AND TRAINING

Further to the *Drinking Water Protection Act*, the Drinking Water Protection Regulation (DWPR) came into effect May 16, 2003. The regulation includes classification of distribution and treatment systems and qualification standards for persons operating these systems through the Environmental Operators Certification Program (EOCP).

The District's water distribution system is classified as Level 4. However, the legislation is silent on the target deadline for minimum certification requirements for District staff operating, maintaining, or repairing the water system. Nevertheless, the District has been working in cooperation with the Health Authority and EOCP towards having operators certified to Level 4. Treatment plants are assessed separately, as mentioned in sections 3.2.1 and 3.3; both the Eagle Lake and Montizambert Treatment Plants are classified as Level 3 facilities.

7.1 Operator Qualifications

The municipality has a staff of five distribution operators, three treatment operators and one supervisor. Two treatment plant operators also hold EOCP distribution certification.

All staff persons are encouraged to take courses, which will enable them to advance to higher EOCP class levels.

In 2013, District staff maintained the following certification levels:

Water distribution:

- Level 4 – one
- Level 3 – two
- Level 2 – three

Water treatment:

- Level 3 – one
- Level 2 - one
- Level 1 - one

8.0 EMERGENCY RESPONSE PLANS

8.1 E. coli Positive Response

If a sample analyzed by Metro Vancouver Laboratories is tested positive for E. coli, the following response plan will occur.

1. The municipality's water quality personnel and the MHO will be notified via the Metro laboratory.
2. Results of interim samples, if any, from the site will be examined. (Interim samples are any samples that may have been taken from the site in the period between when the E. coli positive sample was taken and when it was determined to be E. coli positive.)
3. Arrangements will be made for the immediate collection of a repeat sample (including, where possible, samples from upstream and downstream of the E. coli positive sample location).
4. Water treatment personnel will be contacted to determine if an interruption of source water disinfection had occurred in the period before the E. coli positive sample was taken.
5. The chlorine residual for the sample noted on the sampler's Water Sample Data Sheet will be reviewed to determine if a localized loss of disinfectant residual has occurred.
6. All water utility personnel will be contacted to determine if there has been any loss of pressure or other unusual events that may have led to contaminants entering the water system.
7. The need for boil water advisory will be evaluated and if deemed necessary by the MHO, the VCHA and the municipality will carry out various means to inform the public. Metro Vancouver will be informed of this public advisory.
8. The MHO and District staff shall determine the extent of the boil water advisory.
9. Metro Labs will initiate procedures necessary for the identification of E.coli with standard biochemical tests.
10. The District will provide the MHO with repeat sample results and continue to sample until three consecutive samples show no E.coli detectable per 100 mLs.

8.2 Chemical or Biological Contamination Response

In the event of chemical or biological contamination, in either the source waters (Eagle Lake, Montizambert Creek) or the distribution system, the MHO will be immediately notified. The chemical will be identified and any public health risk factors associated with the chemical presence in the potable water will be determined. Steps will be taken to isolate the contaminated zone area and the level of contamination will be determined through water testing and sampling. Through consultation with the MHO, a public advisory will be communicated. All steps to ensure public health and safety including, if necessary, banning of water usage will be undertaken.

8.3 Turbidity Response

In general, turbidity has not been known to be a persistent problem in the District's water supply (see Section 4.2.1), although on occasion, elevated levels can be experienced. Water quality has improved greatly with the introduction of the Eagle Lake and Montizambert Membrane Filtration Facilities, which produce treated water with turbidity of less than 0.1 NTU.

During periods of elevated turbidity, representatives from Metro Vancouver, the Health Authorities, and local municipalities will review communications protocols. Meanwhile, the District continues to follow an existing turbidity response plan, which was developed in cooperation with the VCHA. The approach understands the need to increase and maintain chlorine dosage rates and residuals during periods of elevated turbidity while minimizing the levels of disinfection by-products whenever possible.

The following actions will be taken regarding turbidity in source waters.

1. The District will conduct regular sampling of Eagle Lake and Montizambert sources to monitor turbidity.
2. The District will take into consideration the effectiveness of increased chlorine dosage, the chlorine contact time, the source of turbidity, and the quality of the Metro Vancouver supply in its response to minimizing the amount of turbidity entering the water system.
3. A turbidity level of >1 NTU will be the trigger for municipal operational actions.
4. During turbidity events >1 NTU, the level of primary chlorination at Eagle Lake and Montizambert sources and at any secondary chlorination points will be increased accordingly.
5. During turbidity events of >5 NTU, a rigorous sampling program for microbiological activity throughout the distribution system will be conducted.
6. During turbidity events of >5 NTU, a public communication may be issued in consultation with the Health Authority.
7. During turbidity events >2 NTU and <3 NTU, the District will consider switching to the Metro Vancouver supply, depending on the turbidity of that supply.
8. During turbidity events >3 NTU, the District will switch to the Metro Vancouver supply, if possible, should the turbidity of that supply be <1 NTU.
9. Two consecutive days of turbidity <1 NTU shall pass before lowering chlorine dosage to pre-event levels.
10. During turbidity events of >5 NTU and while the Eagle Lake treatment plant is in bypass mode, the District may issue a boil water advisory in conjunction with the MHO to residents receiving such water.
11. After a turbidity event of >5 NTU, two consecutive days of turbidity <1 NTU shall pass before rescinding the water quality advisory.

8.4 Response to Interruption of Secondary Disinfection

The District's SCADA system constantly monitors the secondary chlorination stations. This system automatically alerts utility personnel of any disinfection failures, all of which are reported to VCH. Utility personnel carry out immediate repairs to equipment and if necessary, manual disinfection is established. Chlorine residual samples are to be taken at various points in the distribution system to ensure adequate free chlorine residual is present. In cases where

chlorine residual is less than 0.2 ppm, municipal crews will flush the affected area until the desired level is achieved.

Upon notification by Metro Vancouver Operations that an interruption in disinfection has occurred, the municipality will immediately commence monitoring of chlorine residuals at strategic locations in the Metro Vancouver supply area. The monitoring will continue until disinfection is resumed and desired levels have been reached within the distribution system.

9.0 CONCLUSIONS

Overall, the residents of West Vancouver enjoy very high quality drinking water. Given the protected nature of the Eagle Lake and Montizambert Creek watersheds, very low levels of E. coli, giardia, and cryptosporidium exist in the raw source waters.

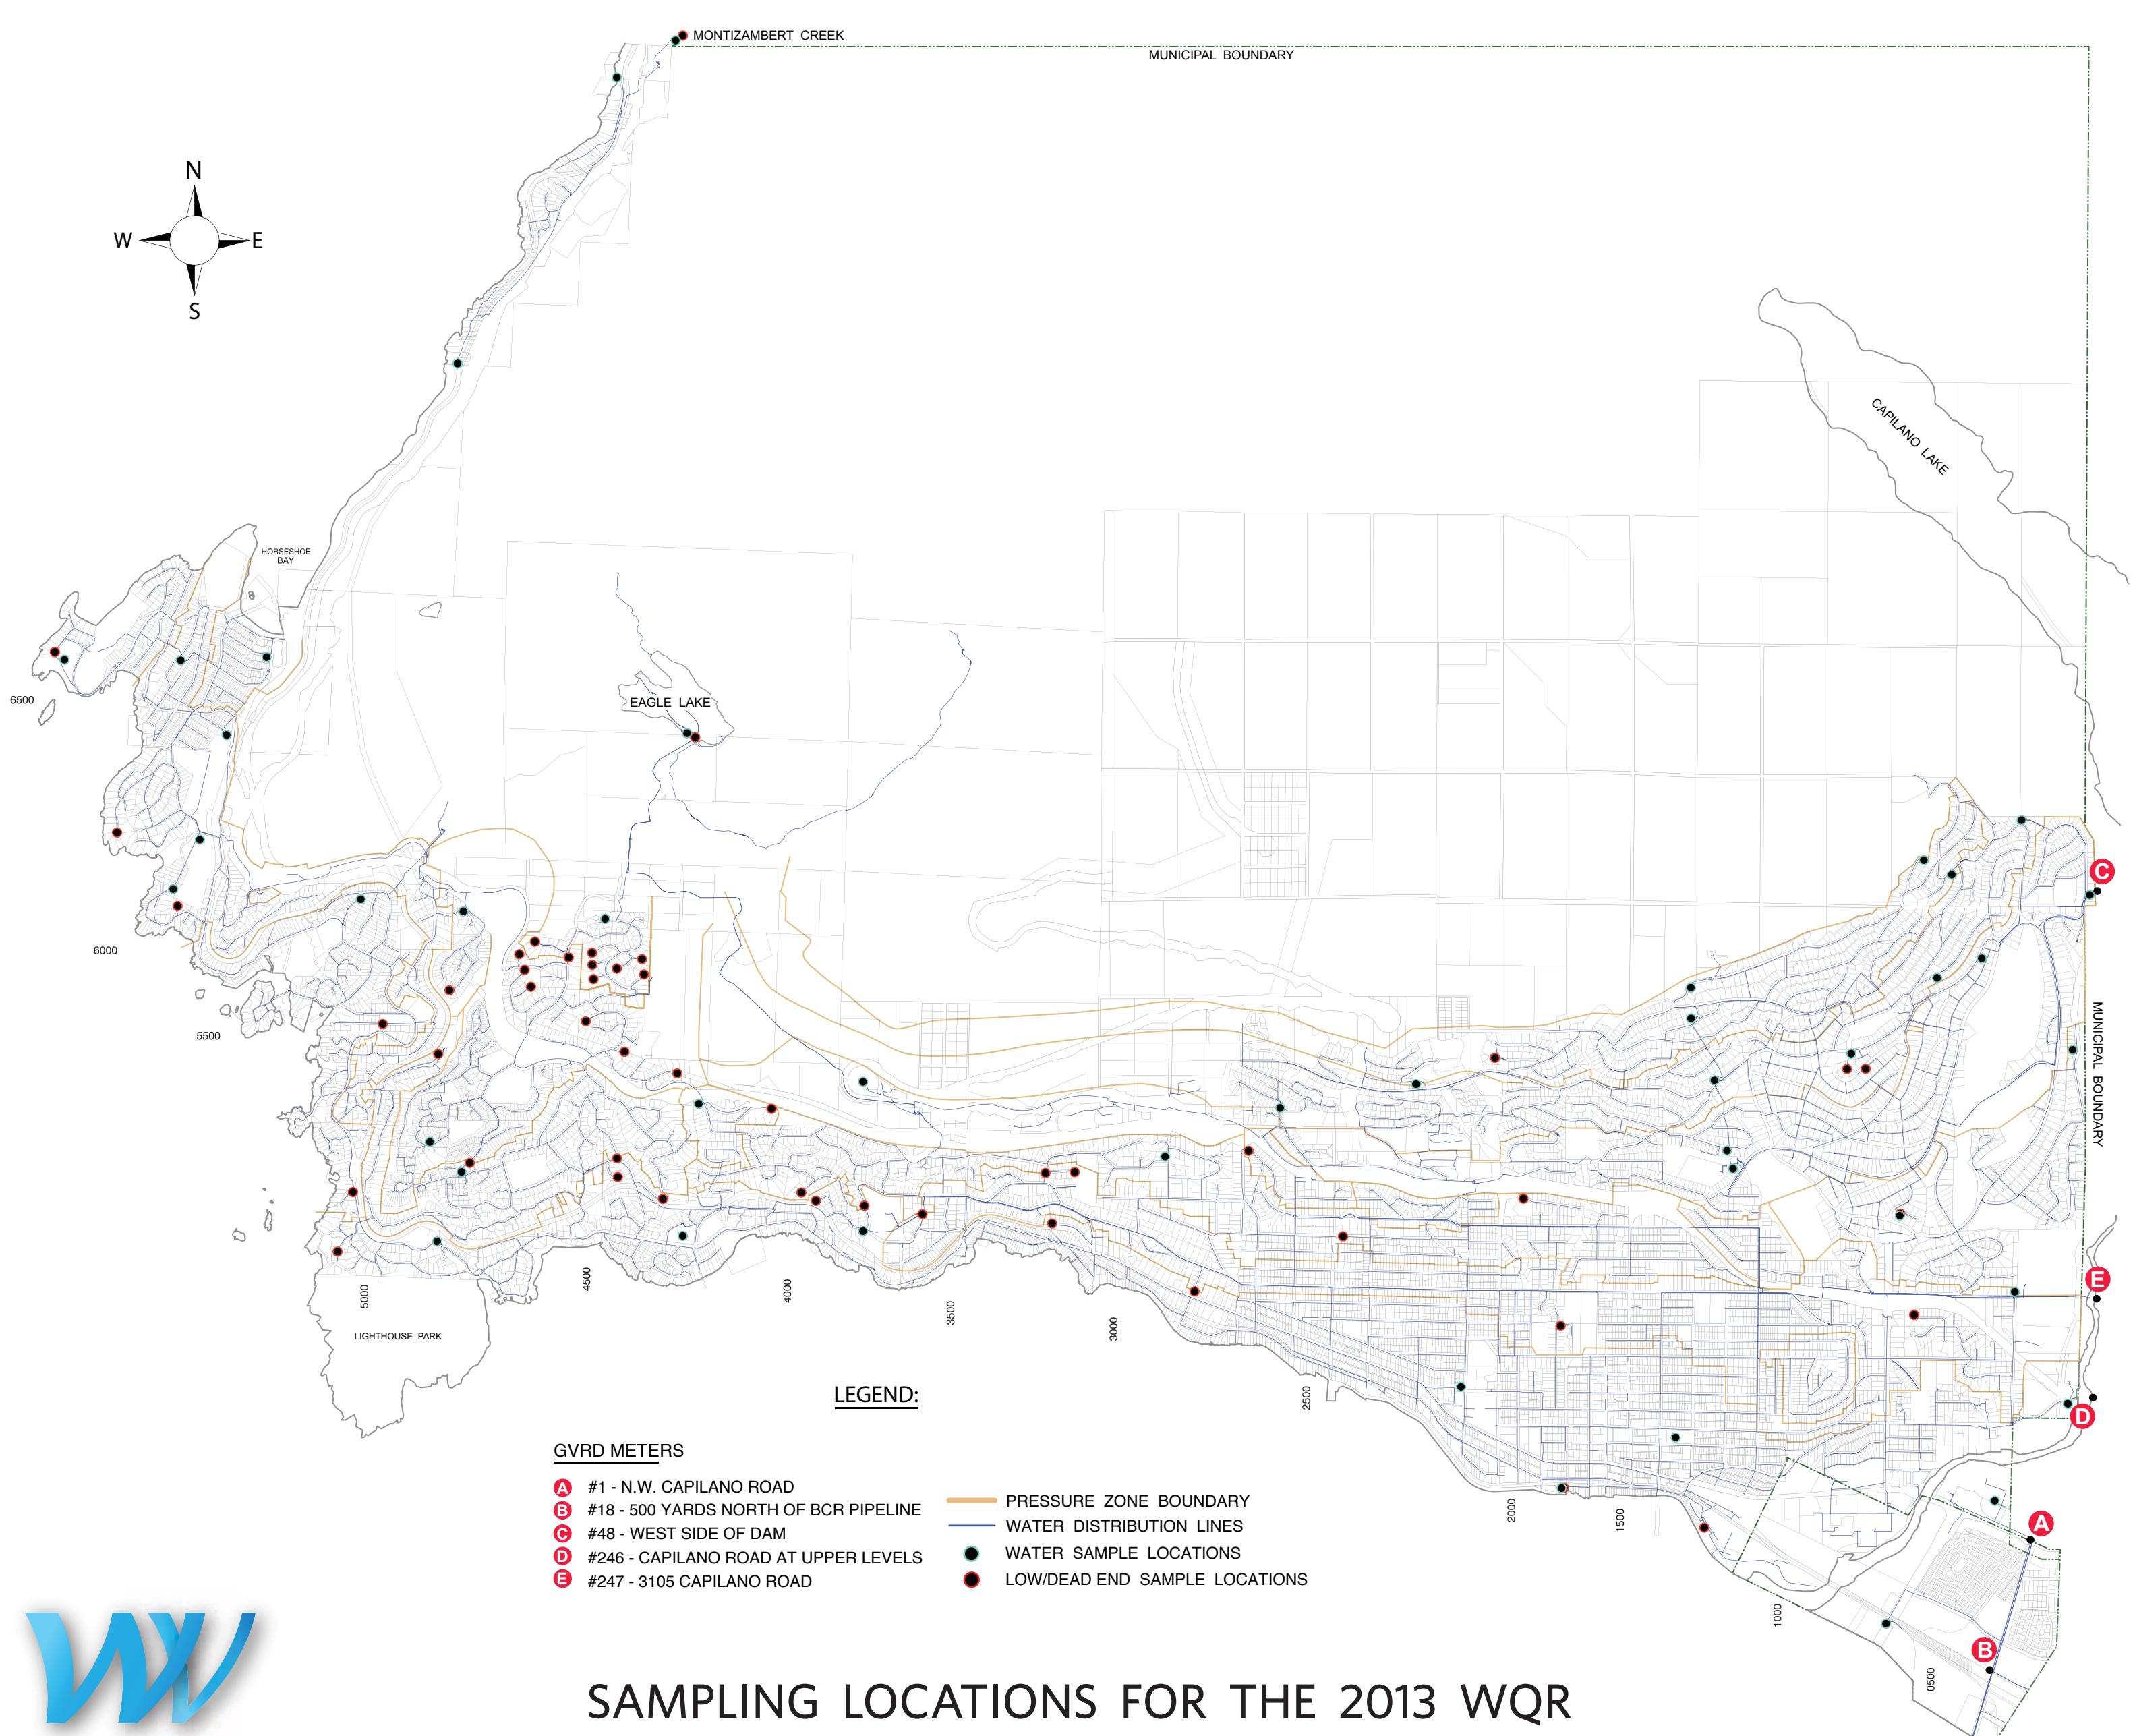

District staff continues to take a balanced approach and employ best management practices in the operation and maintenance of the water system to maintain high water quality.

In 2013 the District's distribution water supply met the requirements as outlined in the GCDWQ for THMs and HAAs, quarterly averages did not exceed the guideline levels during 2013.

In closing, it is noted that the District appreciates the good working relationship with public health staff and acknowledges the Health Authority as a partner in maintaining high quality drinking water in the municipality.
